

RABBIT & SPARROW

The Grove

a living garden for your terrace

Forty plants. Two square feet. Zero gardening experience. A sculptural hydroponic tower that turns the unused corner of your rooftop into the place dinner comes from.

DELHI NCR

WHERE CONCEPT MEETS CRAFT

The corner of your terrace that *feeds* you.

Most terraces in Delhi hold a few pots, a folded clotheshorse, and a view nobody sits down for. The Grove changes what that space is *for*.

It is a vertical growing tower — soil-free, self-watering, quietly beautiful — that grows forty plants at once in the footprint of a side table. Lettuce, basil, coriander, pak choi, chilli, cherry tomato. Picked the evening you eat them, ten steps from your kitchen.

It doesn't look like a gardening project. It looks like it was designed for the space it stands in. Because it was.

LESS WATER
THAN SOIL

02 HOW IT WORKS

Roots in water, not in soil.

A quiet pump lifts nutrient-rich water from the base reservoir up through the centre of the tower. It trickles down past every plant's roots and returns to the base — a closed loop that runs on its own, day and night.

No digging. No soil. No mess on the terrace. Plants fed this way grow **30–50% faster** than in soil and use a fraction of the water, because nothing drains away into the ground.

A

It waters itself

The pump runs continuously. You top up the reservoir, and the system does the rest.

B

It feeds itself

A simple two-part nutrient mix keeps every plant fed. We set your starting levels for you.

C

It fits anywhere

One power point and a flat patch of floor. Balcony, terrace, or courtyard — it belongs.

From the tower *to the table.*

Leafy greens are ready in weeks. Herbs you'll cut again and again. Fruiting crops for the patient. Here's what thrives — and roughly how rich the water wants to be for each.

A SINGLE EVENING'S PICK — GROWN ON THE TERRACE, DRESSED IN THE KITCHEN

GROWS WELL	EXAMPLES
Leafy greens	Lettuce, spinach, kale, pak choi, coriander
Herbs	Basil, mint, parsley
Fruiting crops	Tomato, chilli, capsicum, cucumber, strawberry

THE HONEST PART

You control exactly what goes into the water — and what doesn't. No soil-borne pests, no guesswork from a packet. Greens taste cleaner because you decided what fed them.

Start with greens

Lettuce and herbs are the fast, forgiving way in. Most growers begin here and never quite stop.

Five minutes a day. *That's the whole job.*

No green thumb required — just a short daily glance. Here's the entire rhythm of owning one.

1

Top up the water

Add fresh water to the reservoir when it runs low. The system uses RO water to keep the plants their healthiest.

2

Check the feed

A pocket meter (included) tells you when the water needs more nutrient. A quick reading, a quick top-up.

3

Glance at the greens

Healthy colour, white roots, water flowing at every level. Thirty seconds tells you all is well.

4

Pick what's ready

Cut leaves from the outside in and the plant keeps giving. Refresh the full nutrient mix every 7-10 days.

YOUR DAILY FIVE-MINUTE CHECK

- | | |
|--------------------------------|----------------------------|
| ✓ Water level topped up if low | ✓ Leaves healthy in colour |
| ✓ Feed level reading on target | ✓ Roots white and clean |
| ✓ Water flowing at every tier | ✓ Pump running quietly |

That's it. We hand over the tower fully planted and running, set your starting nutrient levels, and stay a message away. The first harvest does the convincing.

Some evenings begin
with a walk to the terrace.

₹12,000

Includes delivery, installation & growing guidance

RABBIT & SPARROW
THE GROVE

Send us a photo
of your terrace.

We'll show you exactly where The Grove would
stand — and what you could be growing by next
month.
